

# "BookShelf" Web App Report

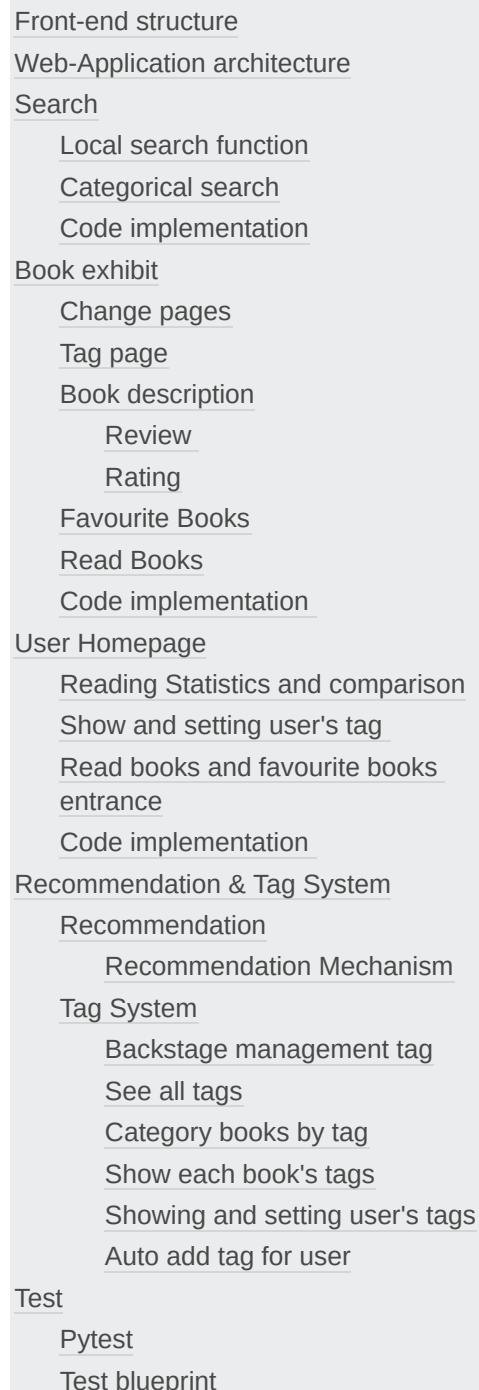

| Author: Haiqiang Zhang & Jinhua Fan

We design the "BookShelf" Web App to show books information, manage user's reading data, and provide personal recommendations to specific users. We hope it will develop into the best **digital reading management tool!**

User can use the web app to realize the entire process of reading management: choosing book  
→ manage favourite book list → add book to read list → compare with other user to stimulate the reading passion → review books.

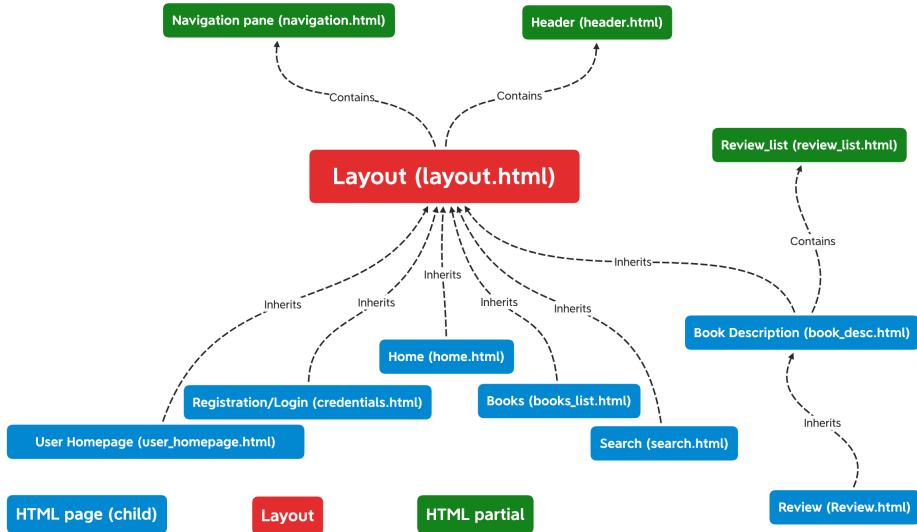

We will continuous develop the web app in the future.

I will cover the features of each unit separately below:

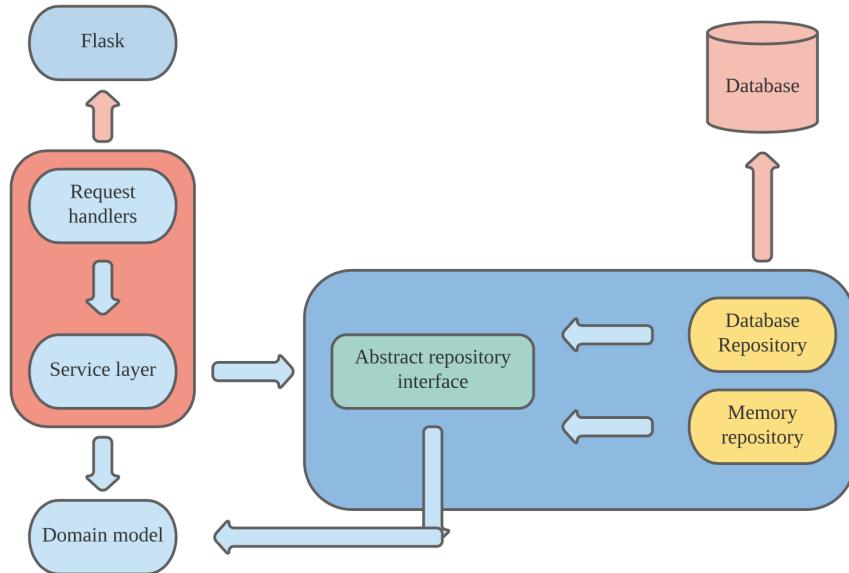

## Front-end structure

This diagram below shows the front-end structure of the "bookshelf" web app:

## Web-Application architecture

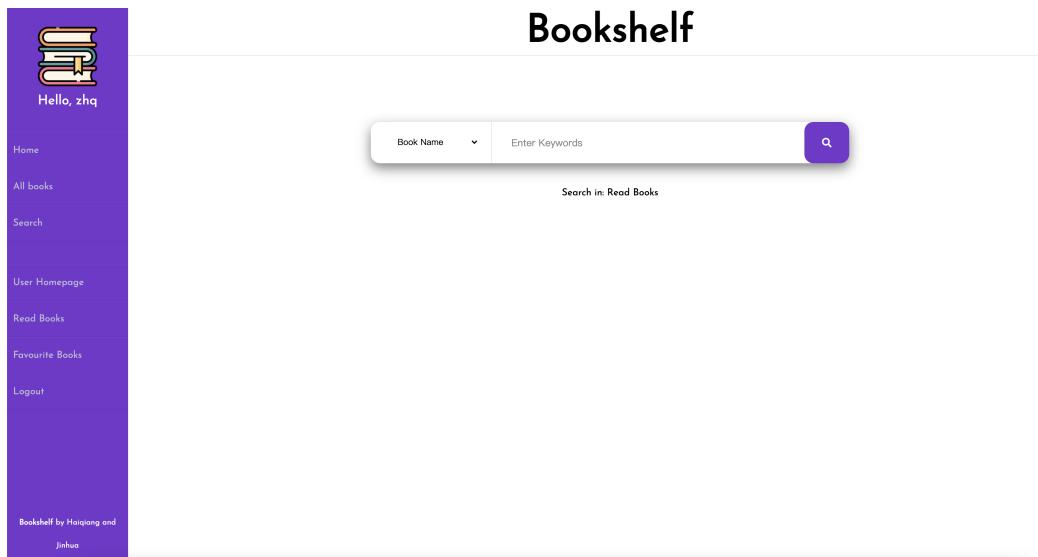

The diagram below shows the back-end architecture of "bookshelf" web app:

- We follow the architecture in the development.
- we follow Single responsibility principle.

## Search

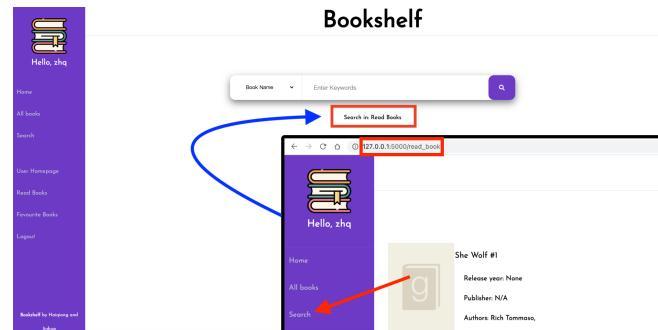

Search page has a simple and beautiful UI with Full functionality.

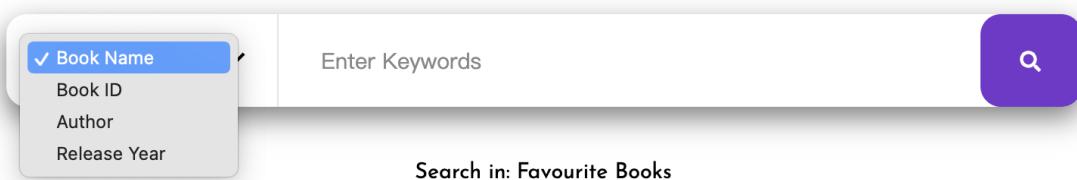

## Local search function

We can click search button in any pages.

When we click search button in All books, read books, favourite books' list, the page only search this part of books. And the Search scope show in the page.

## Categorical search

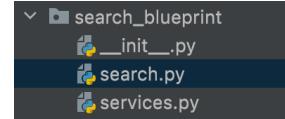

- You can choose four search types to search.
- Book Name and Author support Fuzzy search technology.

# Code implementation

- I make a new blueprint to implement search function with services layer.

```
search_blueprint = Blueprint(  
    'search_bp', __name__  
)
```

- I make two views in search blueprint.
- I use two method in services to connect repository and finish search algorithm.

```
def get_search_books(request_search_scope:str, repo_instance:AbstractRepository)  
def search_book(repo_instance:AbstractRepository, select_items, search_content, list_book)
```

- Because you need to search for books in different ranges, you don't search in the all books list every time, so you can't call repo\_instance directly. So I added several methods to the memory repository specifically to search for a given list.

```
def get_books_by_title_and_given_list(list_book: List[Book], title: str)  
def get_book_by_id_and_given_list(list_book: List[Book], id: int)  
def get_books_by_author_and_given_list(list_book: List[Book], author_input: str)  
def get_books_by_year_and_given_list(list_book: List[Book], release_year: int)
```

# Book exhibit

On all books page, you may find all the books that we have on our website. We have ten tags that you can choose to see the books with the specific tag. If you click on the Action button on the top, you will be redirected to the web page containing all the books with this tag.

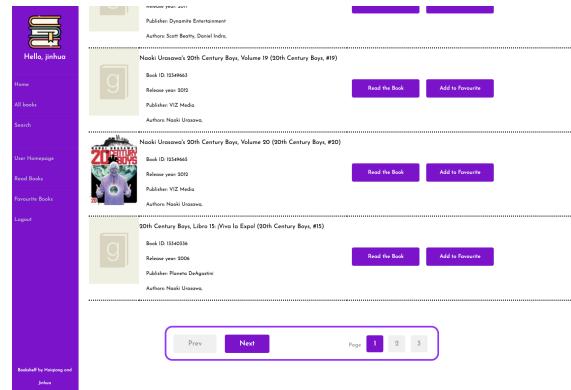

You can add this book to your Read Books shelf or Favourite Books shelf by click on the two buttons on the right of different books. Clicking on the book title and book

The screenshot shows a 'Bookshelf' page with a sidebar on the left containing user information ('Hello, joshua') and navigation links ('Home', 'All Books', 'Search', 'User Homepage', 'Read Books', 'Favourite Books', 'Logout'). The main content area is titled 'All Books' and displays a list of books. Each book entry includes a thumbnail, title, author, publisher, and two buttons: 'Read the Book' and 'Add to Favourite'. The books listed are 'Supergirl Archives, Vol. 2', 'The Thing (Idiot of Millions)', 'A1 Revolutions, Vol. 1', and 'Sherlock Holmes: Year One'.

image, you will see the full details of this book.

## Change pages

At the bottom, we also implement a page select bar. You can go to these pages by click on the different numbers or click on the Next button to get to the next page, as shown below.

I use `form_book_list()` in `book_blueprint → services` to abstract change pages function to general the function.

```
def form_book_list(target_page, books_list, url, tag_str = None)
```

## Tag page

This is the Action Books page. On this page, you will see all the books related to the tag of Action, and on the top, you will see the title of Action Books and the number of books.

You can read and add to favourite in the page directly.

## Book description

On the book description page, we can see this book's full details and all the reviews for this book. If we click on the Review Button, an adding review window will show up, as shown below.

## Review

On the review window, we can comment this book and set our rating for this book as well. If we click on the Submit Button, this book's review will automatically display the reviews at the bottom of the book description page.

The screenshot shows a purple sidebar on the left with navigation links: Home, All Books, Search, User Message, Read Books, Favourite Books, Logout, and Bookshelf for joshua and joshua. The main content area displays the book 'Captain America: Winter Soldier' with its cover image, publication details (Book ID: 30001, Release year: 2011, Publisher: Marvel Comics Ltd, Author: Ed Brubaker), and a 'Review' section. A purple 'Review' button is visible at the bottom of the review form. Below the book details, there is a 'Description' section with a note about the plot.

Afterwards, you will see the new review of this book is added. Each book review contains the user name, rating by the user, submit time and the comment. Recent reviews will be appended after the older reviews.

This screenshot shows the same book detail page for 'Captain America: Winter Soldier'. The 'Review' section now includes a new entry from 'User Name: joshua' with a rating of 5, submitted on 'Time: 2015-08-22 20:05:30 (00045484530)' with the comment 'Great Book!'. The purple 'Review' button is no longer present.

## Rating

- There is a rating about this book based on the review ratings when the number of reviews is greater than zero.
- If the number of reviews is zero, average rating will not be shown.

This screenshot shows the book detail page for 'Captain America: Winter Soldier'. The 'Review' section displays two entries from 'User Name: joshua' with ratings of 1 and 5 respectively. The average rating is highlighted in a red box as 'Average rating: 3.0 (2 people have rated this book)'. The purple 'Review' button is present at the bottom.

## Favourite Books

We can understand that the Favourite book list provides users with the function of marking important or very like books, or the user's todo list

We have two ways to get to Favourite Books and Read Books. We can access

The screenshot shows a purple sidebar with the same navigation links as before. The main content area is titled 'Favourite Books'. It lists two books: 'Superman: Archives, Vol. 2' (Book ID: 30191, Release year: 1997, Publisher: DC Comics, Authors: Jerry Siegel, Joe Shuster) and 'A.I. Revolution, Vol. 1' (Book ID: 255040, Release year: 2007, Publisher: Gollancz, Authors: Ian McEwan). Each book entry has a 'Delete the book' button.

from the left navigation bar and user homepage shown above to get to these two web pages when the user has logged in.

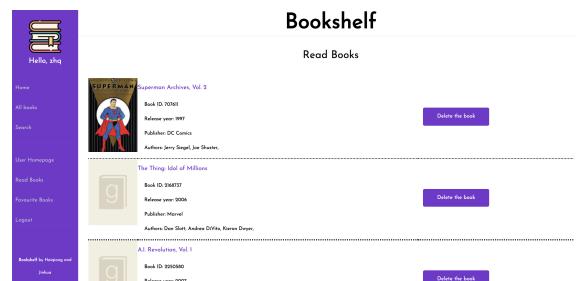

If you have favourite three or more books with the same tag, this tag will be automatically added for you.

You can delete book in the page.

## Read Books

On this page, you can see all the books you have read, and we cannot add the book to read books or favourite books on this page. You can click on the image or the book title to access the full description of this book shown in the following screenshot.

You can delete book in the page.

## Code implementation

These functions are all about book exhibitions. So I set these functions(views) to one blueprint.

```
book_blueprint = Blueprint(  
    'book_bp', __name__  
)
```

## User Homepage

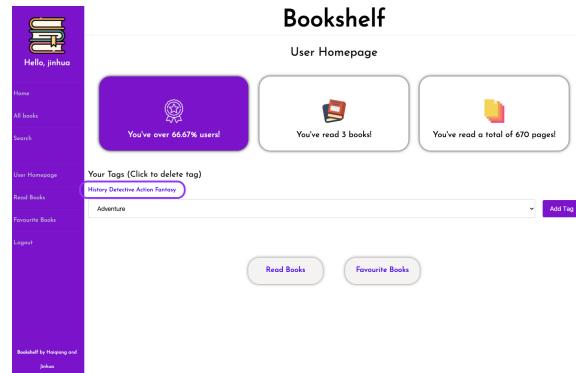

### Reading Statistics and comparison

On the first row, you can find how many books and pages you have read on the user homepage, and your total number of reading books have defeated how many users.

- It is clear
- A fusion of Skeuomorph and Flat design

## Show and setting user's tag

Then, in the middle of the page, there are your tags. You can add specific tags, which the web page will recommend the books with your favourite tags to you. You can easily add tags by choose your favourite tags on the combo box and click on add tag. Then, your tags will show up. You may click on these tags if you don't want these tags anymore. This page is only shown when the user has logged in, and your user name will appear on the top left.

## Read books and favourite books entrance

You may also access your read books and favourite books by clicking on the Read Books button and Favourite Books button in the middle of the user homepage. Then, it will redirect you to the new web page that contains all the books you read or favourited.

## Code implementation

I set a separate blueprint to implement user homepage

```
user_homepage_blueprint = Blueprint(
    'user_homepage_bp', __name__
)
```

## Recommendation & Tag System

### Recommendation

We will recommend books on the

homepage, and we can also read and favourite the recommended books directly.

When we click on the picture or title, we will enter the book details interface.

Let me introduce our recommendation mechanism below.

The screenshot shows the Bookshelf application's user interface. On the left, there is a sidebar with a purple header containing the text "Hello, ziq". Below the header, the sidebar includes links for "Home", "All Books", "Search", "User Homepage", "Read Books", "Favorite Books", "Logout", and "Bookshelf by Honggang ziq". At the bottom of the sidebar is a "Logout" button. The main content area has a header "Bookshelf" and a sub-header "Personal Recommendation". Below this, a book detail card is displayed for the movie "Seiyaku-koi 12". The card features a thumbnail image of a man and a woman, the title "Seiyaku-koi 12", the release year "2013", the author "Maki Horomi", and the genre "Romance, Comic". A detailed description of the movie is provided in Indonesian. At the bottom of the card are two buttons: "Read the Book" and "Add to Favorite".

## Recommendation Mechanism

- For users who are not logged in, we will randomly recommend books.
- For users who have logged in, we will recommend books based on the user's tag.
- We will not recommend books that users have read or are in the favorite list.
- We will automatically add tags to users based on their favorite book list.
- But when a user deletes a book in the favorite book list, the system will not automatically delete the user's tag, because this is the user's historical preference.

## Tag System

### Backstage management tag

We only need to add tags to **tags.csv** to manage the total tag types of this web app

- The **tags.csv** path: `library/adapters/data/tags.csv`
- Add one new row for new tags

tag_name
Action
Adventure
History
Comic
Detective
Mystery
Fantasy
Fiction
Horror
Romance
Sci-Fi

### See all tags

We can see all tags in all books list page.

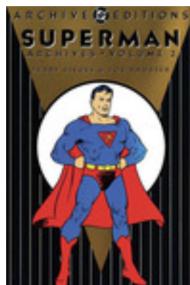

## Category books by tag

I have introduced this functions in ***Book exhibit → Tag page***

### Show each book's tags

we can see each book's tags in book description page.

Description

These are the stories that catapulted Superman into the spotlight as one of the world's premier heroes of fiction. These volumes feature his earliest adventures, when the full extent of his powers was still developing and his foes were often bank robbers and crooked politicians.

**Superman Archives, Vol. 2**

Book ID: 707611

Release year: 1997

Publisher: DC Comics

Authors: Jerry Siegel, Joe Shuster,

Book tags are: **Comic, Fiction**

[Read the Book](#) [Add to Favourite](#) [Review](#)

## Showing and setting user's tags

I have introduced this functions in ***User Homepage → Show and setting user's tag***

### Auto add tag for user

If you have favourite three or more books with the same tag, this tag will be automatically added for you.

We can see user tag in user homepage page.

## Test

### Pytest

I create pytest to test the web app.

Using the command below to run pytest:

```
$ python -m pytest -v tests
```

All tests are passed.

```
tests/unit/test_services.py::test_cannot_add_user_with_existing_name PASSED [ 89%]
tests/unit/test_services.py::test_authentication_with_valid_credentials PASSED [ 90%]
tests/unit/test_services.py::test_authentication_with_invalid_credentials PASSED [ 91%]
tests/unit/test_services.py::test_can_add_review PASSED [ 92%]
tests/unit/test_services.py::test_CANNOT_ADD_review_for_non_existent_book PASSED [ 93%]
tests/unit/test_services.py::test_cannot_add_review_by_unknown_user PASSED [ 93%]
tests/unit/test_services.py::test_can_get_book PASSED [ 94%]
tests/unit/test_services.py::test_cannot_get_book_with_non_existent_id PASSED [ 95%]
tests/unit/test_services.py::test_get_reviews_for_article PASSED [ 96%]
tests/unit/test_services.py::test_get_reviews_for_non_existent_book PASSED [ 97%]
tests/unit/test_services.py::test_get_reviews_for_book_without_reviews PASSED [ 98%]
tests/unit/test_services.py::test_get_reviews_for_book_with_reviews PASSED [100%]
```

# Test blueprint

I use the test\_blueprint to debug. It can show specific variables' content to debug.

The content will be shown in <http://127.0.0.1:5000/test>

We can call `get_test_content(content)` to transfer parameters
